Purpose and Description of Cancer Mortality: Indian Health Regional Differences, 1989-1993

This monograph delineates cancer mortality rates among American Indians and Alaska Natives (AI/AN's) within the different regions served by the IHS. The table and charts depict the IHS administrative areas, the estimated service population for each area, and the mortality from 1989 to 1993 for different cancer sites. Comparisons are made to the general U.S. population. The intention of this publication is to provide detailed information about the impact of cancer in Native American people.

Overview of the Indian Health Service Program

The Department of Health and Human Service (DHHS), primarily through the Indian Health Service (IHS) of the U.S. Public Health Service (PHS), is responsible for providing Federal health services to American Indians and Alaska Natives. Federal Indian health services are based on the laws which the Congress has passed pursuant to its authority to regulate commerce with the Indian Nations as explicitly specified in the Constitution and in other pertinent authorities. The Indian Health program became a primary responsibility of the PHS under P.L. 83-568, the Transfer Act, on August 5, 1954. This Act provides that "all functions, responsibilities, authorities, and duties... relating to the maintenance and operation of the hospital and health facilities for Indians, and the conservation of Indian health... shall be administered by the Surgeon General of the United States Public Health Service."

The goal of the Indian Health Service is to elevate the health status of American Indians and Alaska Natives to the highest possible level. The mission is to ensure equity, availability, and accessibility of a comprehensive high quality health care delivery system providing maximum involvement of American Indians and Alaska Natives in defining their health needs, setting priorities for their local areas, and managing and controlling their health care program. The IHS also acts as the principal Federal health advocate for Indian people by assuring they have knowledge of and have access to all Federal, State, and local health programs to which they are entitled. It is the responsibility of the IHS to collaborate with these programs and make them aware of the entitlements of Indian people.

The IHS has carried out its responsibility by developing and operating a health service delivery system designed to provide a broad-spectrum program of preventive, curative, rehabilitative, and environmental services. This system integrates health services delivered directly through IHS facilities and staff with those purchased by IHS through contractual arrangements, taking into account other health resources to which American Indians and Alaska Natives have access. Tribes are also actively involved in program implementation.

An example of two laws enacted to improve the health status of American Indians and Alaska Natives are described here. The 1975 Indian Self-Determination Act, P.L. 93-638 as amended, builds upon IHS programs in their communities, and provides funding for improvement of Tribal capability to contract under the Act. The 1976 Indian Health Care Improvement Act, P.L. 94-437 as amended, was intended to elevate the health status of American Indians and Alaska Natives to a level equal to that of the general population through a program of authorized higher resource levels in the IHS budget. Appropriated resources were used to expand health services, build and renovate medical facilities, and set up the construction of safe drinking water and sanitary disposal facilities. It also established programs designed to increase the number of Native American health professionals and to improve health care access for Native American people living in urban areas.

Indian Health Service Structure

The IHS health services delivery system is managed through local administrative units. A Service Unit is the basic health organization for a geographic area served by the IHS, just as a county or city health department is the basic health organization in a State health department. These are defined areas, usually centered around a single federal reservation in the continental United States, or a population concentration in Alaska. A few service units cover a number of small reservations; some large reservations are divided into a number of service units. The service units are grouped into 12 larger cultural- demographic management jurisdictions which are administered by IHS Area Offices.

The IHS is composed of 12 regional administrative units called Area Offices. These 12 Areas are:

Aberdeen	Bemidji	Nashville	Phoenix
Alaska	Billings	Navajo	Portland
Albuquerque	California	Oklahoma	Tucson

As of October 1, 1995, the Area Offices consisted of 144 service units, 76 of which were operated by tribes. The IHS operated 38 hospitals, 61 health centers, 4 school health centers, and 47 health stations. Tribes operated 11 hospitals, 129 health centers, 3 school health centers, 73 health stations, and 167 Alaska village clinics. In addition, there are 34 urban projects ranging from information referral and community health services to comprehensive primary health care services.

IHS Service Population Statistics

The IHS service population counts are based on official U.S. Census county data. The Census Bureau enumerates those individuals who identify themselves as American Indian or Alaska Native, however, the Census Bureau does not record Tribal affiliation. The IHS service population is estimated by counting those American Indians and Alaska Natives who reside within geographic areas in which IHS has clinical facilities ("on or near" reservations). These people may or may not use IHS services.

Native American population estimates beyond the Census year are projected by the IHS through linear regression techniques, using 10 years of Native American birth and death data provided by the National Center for Health Statistics (NCHS).

From 1989-1993, the average annual IHS service population for the entire country was 1,238,932. The Tucson Area had the smallest average service population (24,975) and the Oklahoma Area had the largest (266,624). The IHS service population is increasing at a rate of approximately 2.1% per year. Based upon 1990 Census data, the IHS service population is younger than the U.S. all races population. For the entire IHS service population, 33% were less than 15 years of age, compared to 22% for the U.S. all races population. However, there was considerable variation by area with Nashville

at 29.2% and Aberdeen at 40.3% of the population being less than 15 years of age. Only 6% of the entire IHS service population was greater than 64 years of age compared to 13% in the general U.S. all races population. Again, there was variation by area with Phoenix at 4.4% and Oklahoma at 8.0% of the population greater than 64 years of age. In 1989 the median household income for those AI/AN's residing in the current reservation states was \$19,879 while for the U.S. all races it was \$30,056 . The Aberdeen Area had the lowest median household income at \$12,310, and the California Area the highest at \$28,029.

Sources and limitations of Data

Populations Statistics

IHS Service Population between census years (e.g. 1980 and 1990) is estimated by a smoothing technique in order to show a gradual transition between Census years. This normally results in upward revisions to service population figures projected prior to a Census, since each Census tends to do a better job in enumerating American Indians and Alaska Natives. In 1994 all smoothing techniques had been incorporated and population figures for the years 1989-1993 were revised.

Mortality Statistics

American Indian and Alaska Native vital event statistics are derived from data furnished annually to the IHS by the National Center for Health Statistics (NCHS). NCHS obtains birth and death records for all U.S. residents from the State Departments of Health, based upon information reported on official state birth and death certificates. Those records identified as pertaining to the American Indians and Alaska Natives are provided to the IHS. The IHS records contain the same basic demographic items as the vital events records maintained by NCHS for all U.S. residents, but with names, addresses, and record identification numbers deleted. It should be noted that Tribal identity is not recorded on these records.

It is already known that there is an underreporting of Indian race on State death certificates in California. It also appears that this problem exists in the Oklahoma and Portland Areas. Therefore, throughout this publication, the mortality rates that are shown for these 3 Areas are suspect and should be interpreted with caution. As a result, this publication shows IHS-wide mortality rates both with and without the data for these 3 Areas.

The Native American vital events data in this publication pertain only to those American Indians and Alaska Natives residing at the time of their death in the counties that make up the IHS service areas.

The Native American population is considerably younger than the U.S. all races population. Therefore, mortality rates presented in this publication have been age-adjusted for appropriate comparisons between population groups. An adjusted rate that was computed based on a small number of deaths should be interpreted with caution since the adjusted rate may be very different from the true underlying rate.

Cancer Mortality Among American Indians and Alaska Natives in the United States: Regional Differences in Indian Health, 1989-1993

Introduction

The Indian Health Service has strived to improve the health of Native Americans in the United States (U.S.) for over 40 years. The results have been marked decreases in infectious disease and infant and maternal mortality.^{1,2} Life expectancy at birth for Native Americans throughout the U.S. has also risen dramatically, from 51 years in 1940 to 74 years in 1990. With these improvements in health and this increased life span, chronic diseases have begun to impact heavily on the Native American community. Malignant neoplasms are the second leading cause of death for Native Americans throughout the country.²

Cancer mortality among Native Americans has not been well described. While there are isolated reports from North Carolina³ and for a single Tribe in New York,⁵ most published studies on cancer mortality among Native Americans have been done in the Southwestern part of the U.S. and in Alaska.⁶⁻⁷ These studies have shown that, while total cancer mortality for all Native Americans appears to be lower than the cancer mortality for the U.S. White population,⁶⁻⁸ there are regional differences and differences in mortality from specific types of cancer that are striking.³⁻¹⁷

Overall cancer mortality rates for Native Americans except for the Aberdeen, Alaska, Bemidji, and Billings Areas have been shown to be significantly lower than the US rates.^{3-8,12} In Alaska, excess mortality was seen for nasopharyngeal, kidney, salivary gland, and esophageal cancers,^{13,15} as well as for multiple myeloma.¹⁶ For Alaska and the southwest U.S. excess mortality was seen for gallbladder cancer, especially among females.^{6,7,13,17} In the southwest U.S., excess mortality was seen for stomach cancer.^{7,10} Varying degrees of excess cervical cancer mortality was seen in all regions studied.^{3-8,13}

Deficits in cancer mortality were seen in Alaska for lymphomas and leukemias,¹⁶ in Alaska and North Carolina for prostate cancer,^{3,6,13,15} and for pancreatic in cancer in New Mexico.^{6,7} In all regions studied, varying degrees of deficits in cancer mortality were seen breast cancer.^{3-8,13,15} Lung cancer mortality among Native Americans in New Mexico was significantly lower than U.S. rates.^{6,7,11} However, lung cancer mortality in Alaska has been increasing rapidly from rates significantly lower than U.S. rates in the mid-1960's to rates as high as the U.S. rates by 1983.^{13,15,17}

These studies document that there are marked regional differences in cancer mortality among Native Americans in the U.S. and that results apply only to the region under study. They clearly demonstrate that combined data for the entire U.S. do not adequately describe cancer mortality for specific Native American groups. Additionally, these studies were done using different methodologies and during different time periods, further complicating pooling of data and making comparisons difficult.

The purpose of this publication is to provide current and accurate information about cancer mortality among Native Americans in the U.S.

METHODS

Mortality data is compiled by the National Center for Health Statistics (NCHS) annually. This information includes the single underlying cause of death and is determined according to standard criteria from data listed on the death certificate. This monograph looked at only those Native American deaths between 1989-1993 in which the underlying cause of death was cancer. The IHS obtains the NCHS mortality data tapes for persons listed as Native American.

Based upon information available about residence at the time of death, the IHS assigned each person to the appropriate IHS Area (Chart 1). As is evident in Chart 1, not all parts of the US are included in the IHS Areas. Based upon data from the 1990 census, approximately 50% of all Native Americans in the U.S. reside within the geographic boundaries of the IHS Areas. Only those deaths that occurred among Native Americans residing within the boundaries of IHS Areas were included in this part of the investigation.

To help control for fluctuation in rates that occur when there is a relatively small population and a small number of deaths, five years of data were examined, 1989 to 1993. Data were examined for all cancer deaths combined as well as for specific types of cancer (Table 1). Average annual age-adjusted mortality rates were calculated using the cumulative 1989 to 1993 estimated population for each IHS Area (Table 2: data from the Indian Health Program Statistics Branch). The IHS projected these population estimates with linear regression from the 1990 census, based upon the most recent 10 years of birth and death data for Native Americans in the United States. In this publication the age-adjusted cancer mortality rates were computed by the direct method using the 1970 U.S. standard population.* To compute 95% confidence intervals for each rate, we used the method described by Armitage.¹⁸ If the US all races rate was not included in the calculated 95% interval, we considered the rates to be significantly different at the p<.05 level.

RESULTS

From 1989 through 1993, the average annual age-adjusted cancer mortality rate for all cancers for both sexes combined was 127.3 per 100,000 for all IHS Areas. This rate was significantly lower than the 1988 through 1992 U.S. all races rate of 172.8 per 100,000.¹⁹ When the three IHS Areas with underreporting for Native American race on

=====

* Age-specific rates and rates adjusted to the 1940 U.S. population are not included in this publication, but may be obtained by contacting the IHS Cancer Prevention and Control Program, 5300 Homestead Road NE, Albuquerque, NM 87110. The phone is: (505) 248-4132 and the FAX is: (505) 248-4393.

death certificates (California, Oklahoma, and Portland - Chart 1) are excluded, the IHS rate was 148.2 per 100,000. This rate was also significantly lower. There was wide variation among the IHS Areas; California had the lowest overall cancer mortality rate (70.3 per 100,000) and Aberdeen had the highest (223.3 per 100,000). Four IHS Areas (Alaska, Aberdeen, Bemidji, and Billings) had rates, both sexes combined, that were higher than the U.S. rate with only the Aberdeen Area being significantly higher than the U.S. rate.

When cancer mortality rates were examined by specific cancer site and by sex, wide variation among the IHS Areas as well as diverse rankings by Area were seen. Lung cancer was the leading cause of cancer mortality for the U.S. as well as for all IHS Areas as a whole and among nine of the 12 IHS Areas. Three IHS Areas (Albuquerque, Navajo, and Tucson) had ill defined/unspecified cancer as the leading cause of cancer mortality for both sexes. Detailed results for individual cancer sites are shown in Charts 2 through 32 and Tables 4 through 16. For each IHS Area, the five leading causes of cancer mortality are shown by age-adjusted mortality rates (Table 17). Detailed data by cancer site (number of deaths and age-adjusted average annual rates) for each IHS Area are shown in Tables 18 through 31.

Discussion

The data presented here demonstrate that Native Americans throughout the U.S. carry very different cancer mortality burdens. In general, Native Americans throughout the southwestern part of the country had lower cancer mortality rates than those in the northern part of the country. However, within any IHS Area or geographic region, mortality rates for specific cancers were not all lower or higher than the U.S. rates. For each specific type of cancer and for each sex, varying rankings by IHS areas or regions were found.

Reasons for the variability in cancer mortality seen among Native Americans from different parts of the country are not entirely known. Access to care or later stage diagnosis in different areas could cause different mortality patterns. However, some of the variability in rates would be expected. It is known that the prevalence rates for alcoholism^{1,2,12,26,27} and obesity,²⁸⁻³⁰ as well as dietary patterns,²⁸⁻³⁰ vary considerably throughout the country. Additionally, smoking prevalence among Native American adults is relatively low in Arizona and New Mexico,^{9,31} but is over 50% in the northern part of the country^{31,23} and increasing rapidly in Alaska to rates now over 60%.^{17,31,33} These differences in risk factors could easily explain some of the variation seen in cancer mortality in different parts of the country.

There are several well recognized and documented limitations in using death certificate data to examine cause-specific mortality.³⁴⁻³⁶ These include racial misclassification, errors in residence at a time of death, and errors in reporting the precise cause of death. There is evidence to suggest that, at least in the recent past, racial misclassification of

Native Americans on death certificates may be a problem in some regions of the country.¹⁹⁻²⁵ Additionally, data show that Native Americans die more often than Whites of "signs, symptoms and ill-defined conditions."¹³⁷ These two latter problems would lead to underestimations of the true overall cancer mortality rates as well as underestimations of mortality for specific types of cancer. IHS Area mortality data show ill-defined cancers as the leading cause of cancer mortality for the Albuquerque, Navajo, and Tucson Areas.

All rates in this publication were derived using projections from the 1990 Census. The degree to which there may be errors in the accurate counting of Native Americans is not precisely known. However, evidence would suggest that any errors that may have occurred would be in undercounting. Errors in using population figures that may be lower than the true numbers would lead to overestimation of the true cancer mortality rates for regions of the country where this was a problem.

Despite these limitations, the findings shown here clearly demonstrate that Native Americans throughout the U.S. have very different cancer mortality patterns. The results of this study examining cancer mortality clearly showed that Native Americans in Arizona and New Mexico have markedly different cancer mortality patterns from other Native Americans in the U.S. This finding, along with differences in risk factors, would lead one to presume that cancer incidence patterns would also differ. Unfortunately, there are not sufficient data on cancer incidence among Native Americans to examine whether the same holds true for cancer incidence or survival. Presently, the National Cancer Institute's Surveillance, Epidemiology, and End Results (SEER) population-based tumor registry includes only limited Native American populations. Most of this data on Native Americans comes from the New Mexico Tumor Registry which includes Native Americans in Arizona and New Mexico.

In order to better understand the extent of cancer among Native Americans in the U.S., collaborative efforts between the IHS, SEER, and state-based tumor registries need to be further developed. This would help in developing preventive programs and intervention strategies that need to be targeted appropriately for the population being treated. Until such data are available, cancer mortality data can give some indication as to the extent of the problem and can help provide direction when deciding where limited resources would have the most beneficial impact.

Portland	124,317	127,774	130,426	133,172	136,461
Tucson	23,880	24,607	25,035	25,463	25,891

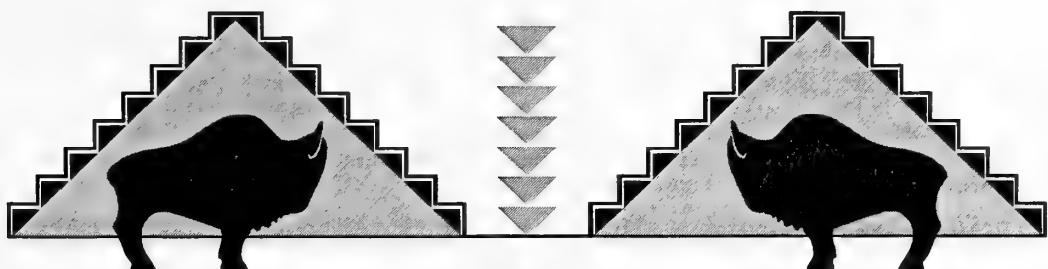

Table 2

SOURCE: Estimated American Indian and Alaska Native service population by Area based on 1984-1993 vital events and the 1990 Census modified age, race, and sex files.

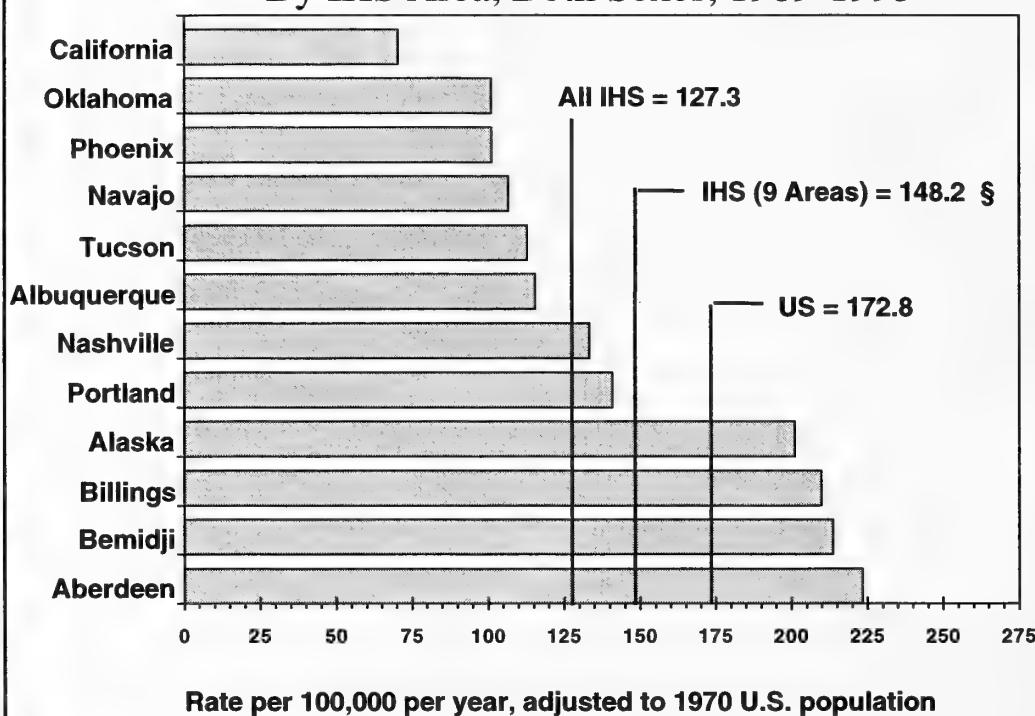

The following thirteen specific cancer sites (Charts 2-32 and Tables 3-15) have been selected to graphically highlight rate comparisons between IHS Areas and U.S. all races by sex. Table 16 shows the five leading cancers by IHS Area and sex. The remaining tables display the number of deaths and rates associated with each cancer site by IHS Area and sex.

Age-specific rates and rates adjusted to the 1940 U.S. population are not included in this publication, but may be obtained by contacting the:

Age-Adjusted Cancer Mortality Rates, All Sites, By IHS Area, Both Sexes, 1989-1993

§ Excludes California, Oklahoma, and Portland Areas in calculation of rate.

Chart 2

The 1989 to 1993 age-adjusted cancer mortality rate for both sexes, pertaining to all cancers, is 127.3 per 100,000 over the entire IHS service population. Without the 3 IHS Areas with apparent problems in underreporting of Indian race on death certificates, the rate is 148.2 per 100,000. Both of these rates are significantly lower than the US rate for both sexes.

Of the IHS Areas, only the Aberdeen Area had a rate significantly higher than the US rate. The Albuquerque, California, Nashville, Navajo, Oklahoma, Phoenix, Portland, and Tucson Areas had rates significantly lower than the US rate for both sexes.

Total Number of Deaths and Age-Adjusted Cancer Mortality Rates, All Cancer Sites, By IHS Area, 1989-1993

	Both Sexes		Males		Females	
	N	Rate	N	Rate	N	Rate
US. All Races		172.8		219.6		141.5

Phoenix	324	101.1 **	157	108.1 **	167	95.4 **
Portland §	491	140.7 **	234	150.1 **	257	133.8
Tucson	80	112.8 **	31	97.0 **	49	126.2

§ Three IHS Areas (California, Oklahoma, Portland) often underreport Indian race on death certificates. Therefore, the IHS (9 Areas) total is presented excluding these 3 Areas.

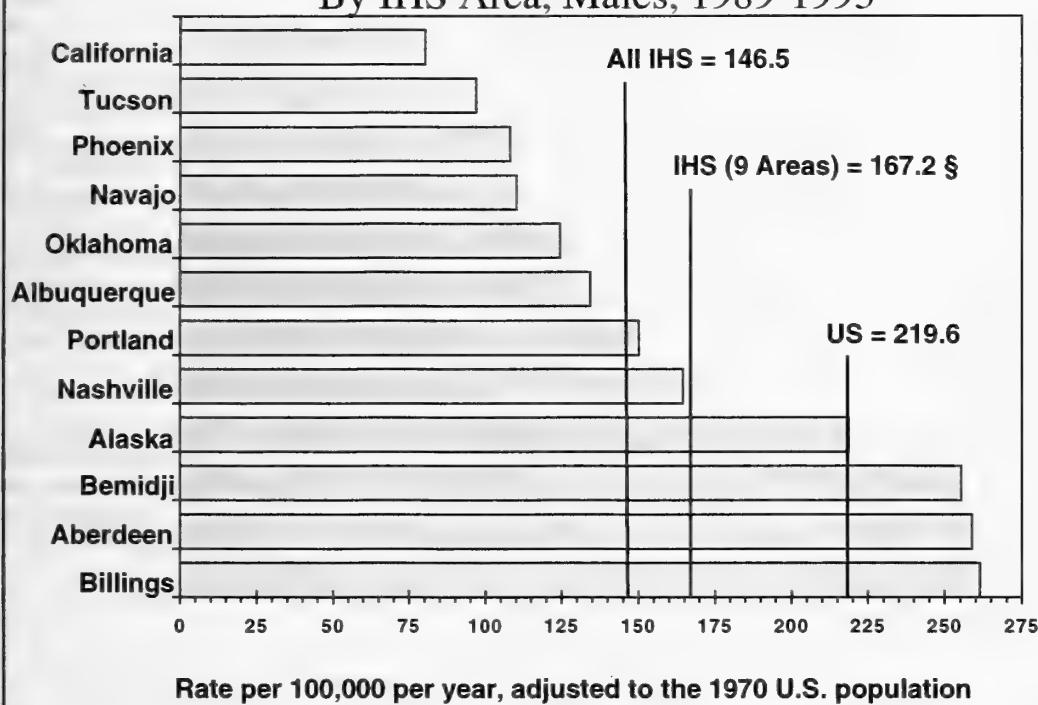

** Denotes a rate significantly different from the US rate.

Table 3 lists the total number of deaths due to all cancers from 1989 to 1993 in addition to the mortality rate by IHS Area for both sexes combined, males, and females.

Mortality rates are calculated per 100,000 per year and are age-adjusted to the 1970 US population. Rates based on small numbers of deaths should be interpreted with caution.

Table 3

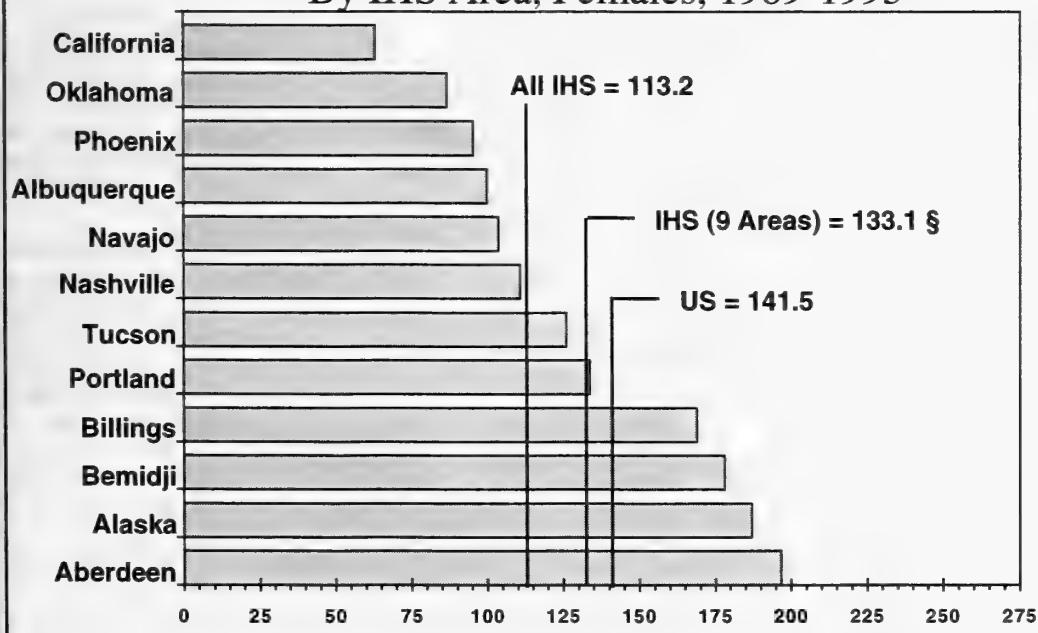

Age-Adjusted Cancer Mortality Rates, All Sites, By IHS Area, Males, 1989-1993

§ Excludes California, Oklahoma, and Portland Areas in calculation of rate.

Chart 3

Age-Adjusted Cancer Mortality Rates, All Sites, By IHS Area, Females, 1989-1993

§ Excludes California, Oklahoma, and Portland Areas in calculation of rate.

Chart 4

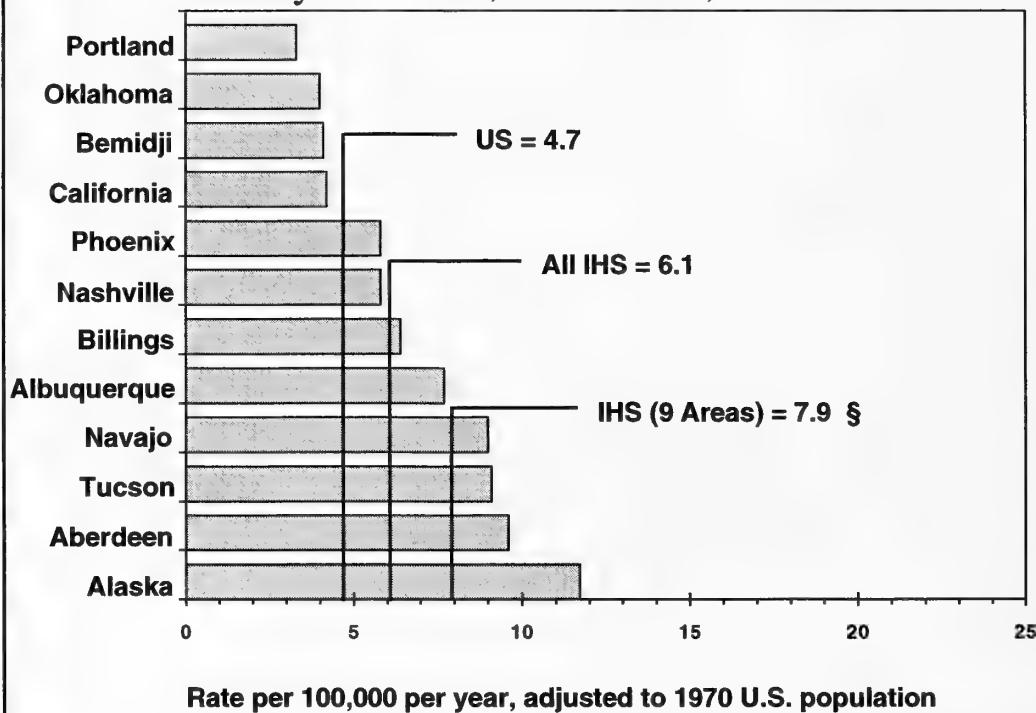

The 1989 to 1993 male age-adjusted cancer mortality rate for all cancers is 146.5/100,000 for the entire IHS service population. Excluding the 3 IHS Areas with apparent problems in underreporting of Indian race on death certificates, the rate is 167.2/100,000. Both of these rates are significantly lower than the US rate for males.

Seven IHS Areas (Albuquerque, California, Navajo, Oklahoma, Phoenix, Portland, & Tucson) had cancer mortality rates for males that are significantly lower than the US rate.

The 1989 to 1993 female age-adjusted cancer mortality rate for all cancers is 113.2/100,000 for the entire IHS service population. Excluding the 3 IHS Areas with apparent problems in underreporting of Indian race on death certificates, the rate is 133.1/100,000. The All IHS rate is significantly lower than the US rate.

Four IHS Areas (California, Navajo, Oklahoma, and Phoenix) had rates for females that are significantly lower than the US rate.

Age-Adjusted Stomach Cancer Mortality Rates, By IHS Area, Both Sexes, 1989-1993

§ Excludes California, Oklahoma, and Portland Areas in calculation of rate.

Chart 5

The 1989 to 1993 age-adjusted cancer mortality rate for both sexes, pertaining to stomach cancer, is 6.1 per 100,000 over the entire IHS service population. Excluding the 3 IHS Areas with apparent problems in underreporting of Indian race on death certificates, the rate is 7.9 per 100,000. The IHS (9 Areas) rate is significantly higher than the US rate for both sexes.

None of the IHS Areas had a rate that was significantly different from the US rate for both sexes.

Total Number of Deaths and Age-Adjusted Stomach Cancer Mortality Rates, By IHS Area, 1989-1993

	Both Sexes		Males		Females	
	N	Rate	N	Rate	N	Rate
US. All Races		4.7		6.8		3.1
All IHS Areas	235	6.1	142	8.3	93	4.3
IHS (9 Areas) §	167	7.9 **	100	10.5	67	5.8

Portland §	12	3.3	8	4.6	4	2.2
Tucson	6	9.1	3	10.5	3	8.1

§ Three IHS Areas (California, Oklahoma, Portland) often underreport Indian race on death certificates. Therefore, the IHS (9 Areas) total is presented excluding these 3 Areas.

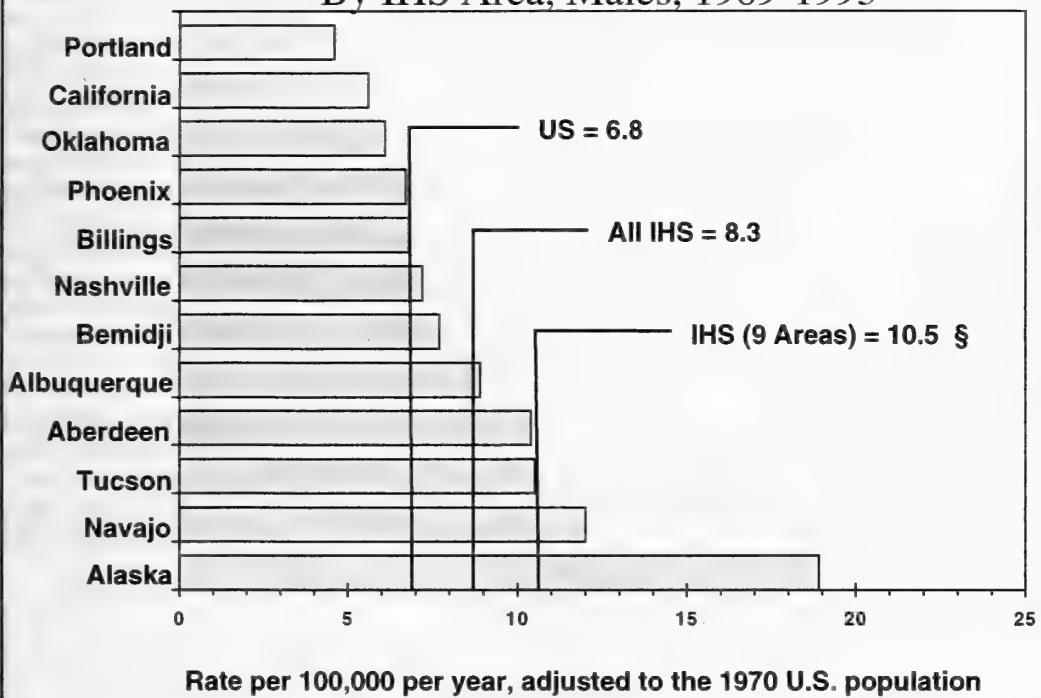

** Denotes a rate significantly different from the US rate.

Table 4 lists the total number of deaths due to stomach cancer from 1989 to 1993 in addition to the mortality rate by IHS Area for both sexes combined, males, and females.

Mortality rates are calculated per 100,000 per year and are age-adjusted to the 1970 US population. Rates based on small numbers of deaths should be interpreted with caution.

Table 4

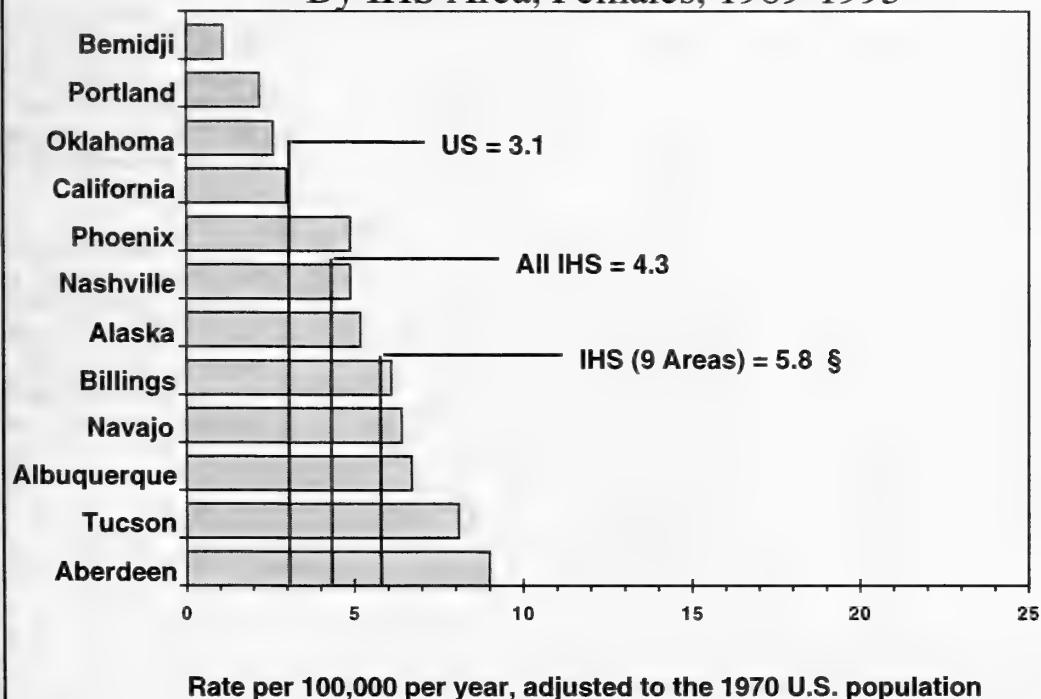

Age-Adjusted Stomach Cancer Mortality Rates, By IHS Area, Males, 1989-1993

§ Excludes California, Oklahoma, and Portland Areas in calculation of rate.

Chart 6

Age-Adjusted Stomach Cancer Mortality Rates, By IHS Area, Females, 1989-1993

§ Excludes California, Oklahoma, and Portland Areas in calculation of rate.

Chart 7

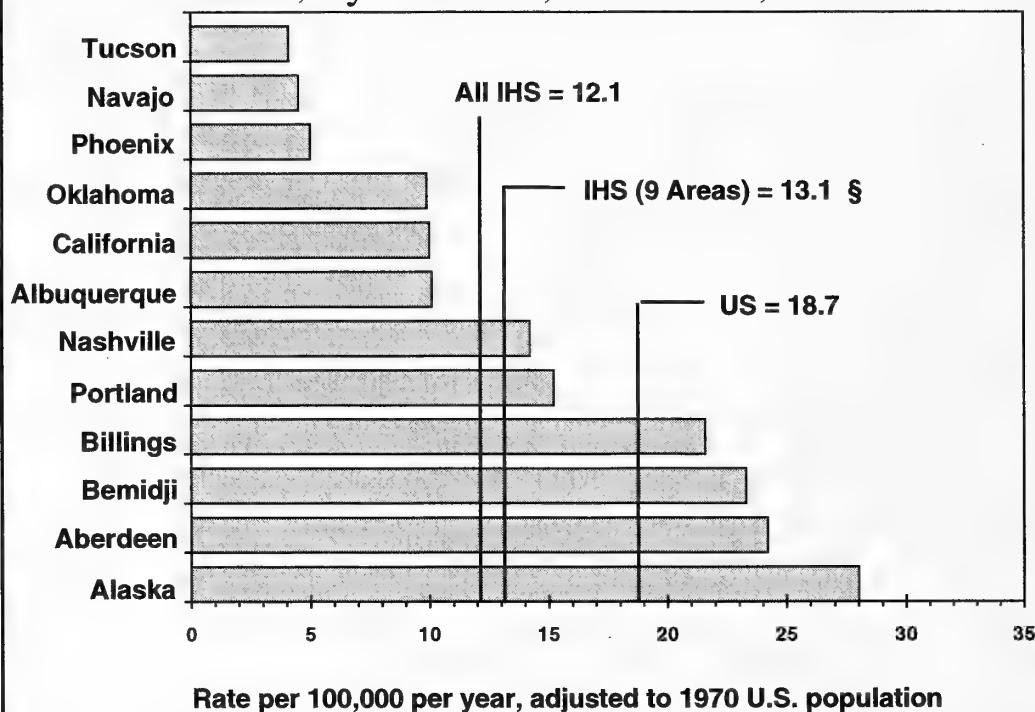

The 1989 to 1993 male age-adjusted cancer mortality rate for stomach is 8.3/100,000 for the entire IHS service population. Excluding the 3 IHS Areas with apparent problems in underreporting of Indian race on death certificates, the rate is 10.5/100,000.

No IHS Area had a rate that was significantly higher or lower than the US rate.

The 1989 to 1993 female age-adjusted cancer mortality rate for stomach is 4.3/100,000 for the entire IHS service population. Excluding the 3 IHS Areas with apparent problems in underreporting of Indian race on death certificates, the rate is 5.8/100,000.

No IHS Area had a rate that was significantly higher or lower than the US rate.

Age-Adjusted Colon/Rectum Cancer Mortality Rates, By IHS Area, Both Sexes, 1989-1993

§ Excludes California, Oklahoma, and Portland Areas in calculation of rate.

Chart 8

Total Number of Deaths and Age-Adjusted Cancer Mortality Rates, Colon/Rectum, By IHS Area, 1989-1993

Tucson	3	4.1 **	1	3.1 **	2	4.9

§ Three IHS Areas (California, Oklahoma, Portland) often underreport Indian race on death certificates. Therefore, the IHS (9 Areas) total is presented excluding these 3 Areas.

** Denotes a rate significantly different from the US rate.

The 1989 to 1993 age-adjusted cancer mortality rate for both sexes, pertaining to colorectal cancer, is 12.1 per 100,000 over the entire IHS service population. Without the 3 IHS Areas with apparent problems in underreporting of Indian race on death certificates, the rate is 13.1 per 100,000. Both rates are significantly lower than the US rate for both sexes.

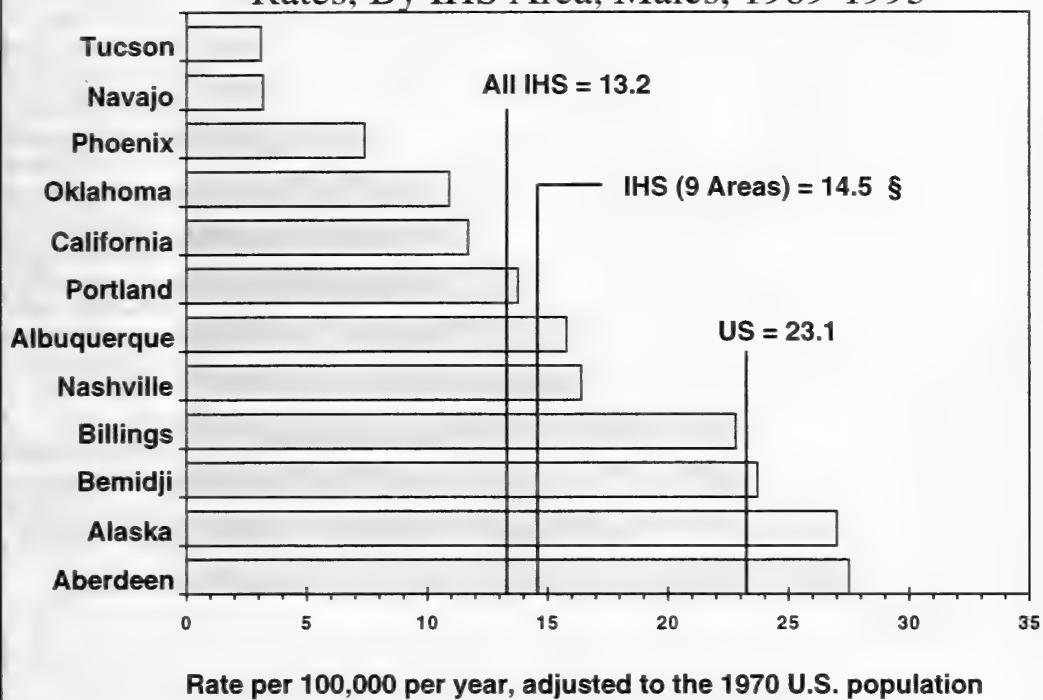

Five IHS Areas (California, Navajo, Oklahoma, Phoenix and Tucson) had rates significantly lower than the US rate for both sexes.

Table 5 lists the total number of deaths due to all cancers from 1989 to 1993 in addition to the mortality rate by IHS Area for both sexes combined, males, and females.

Mortality rates are calculated per 100,000 per year and are age-adjusted to the 1970 US population. Rates based on small numbers of deaths should be interpreted with caution.

Table 5

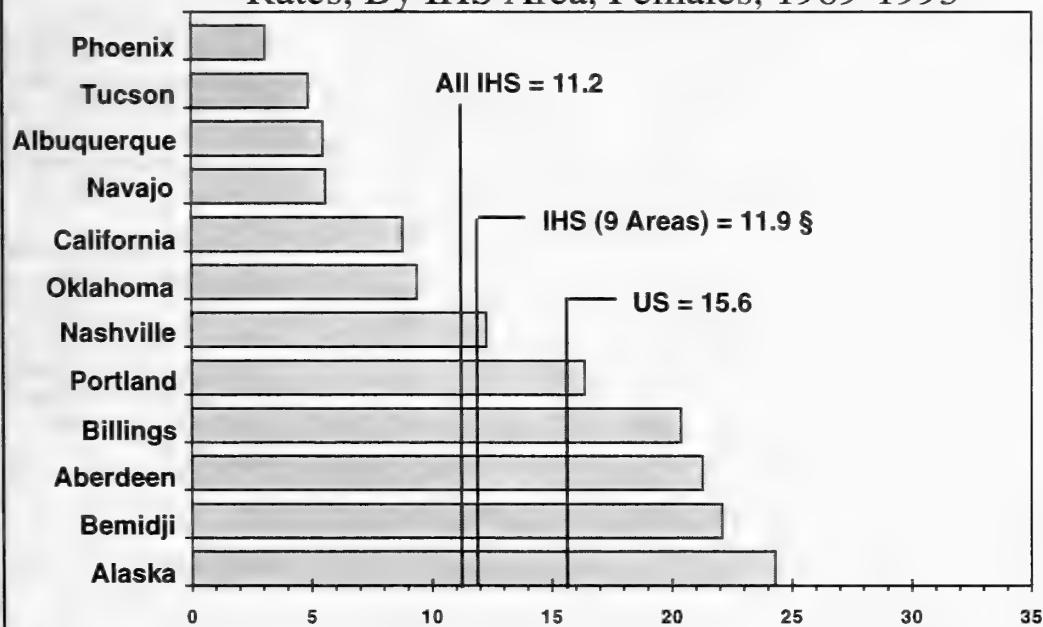

Age-Adjusted Colon/Rectum Cancer Mortality Rates, By IHS Area, Males, 1989-1993

§ Excludes California, Oklahoma, and Portland Areas in calculation of rate.

Chart 9

Age-Adjusted Colon/Rectum Cancer Mortality Rates, By IHS Area, Females, 1989-1993

§ Excludes California, Oklahoma, and Portland Areas in calculation of rate.

Chart 10

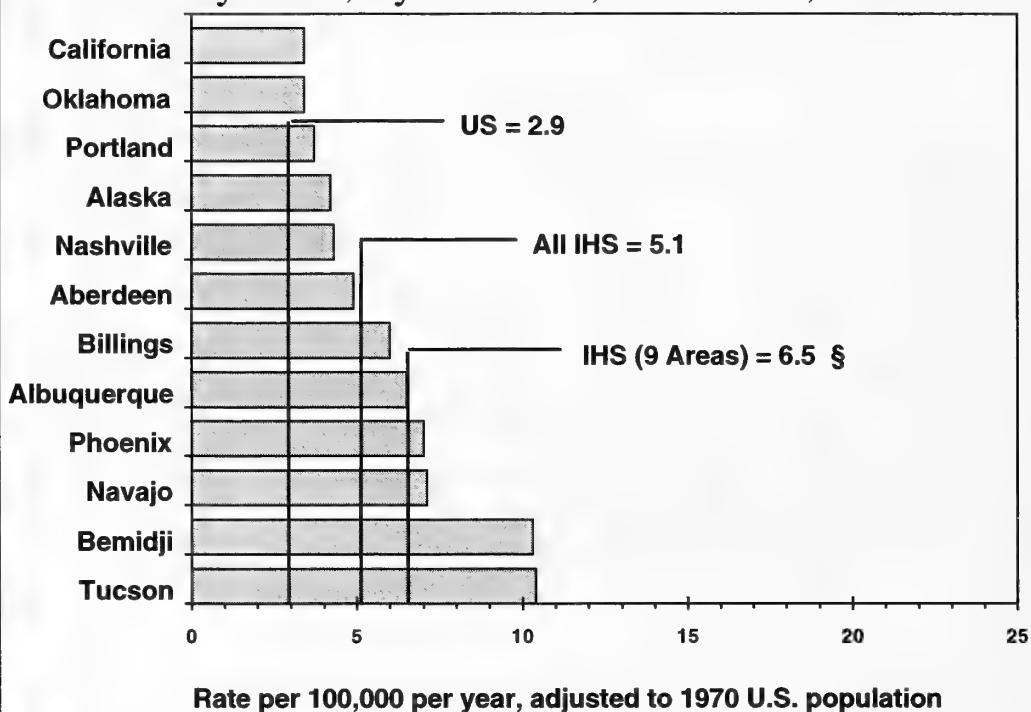

The 1989 to 1993 male age-adjusted cancer mortality rate for colorectal cancer is 13.2/100,000 for the entire IHS service population. Excluding the 3 IHS Areas with apparent problems in underreporting of Indian race on death certificates, the rate is 14.5/100,000. Both of these rates are significantly lower than the US rate for males.

Four IHS Areas (Navajo, Oklahoma, Phoenix, & Tucson) had cancer mortality rates for males that are significantly lower than the US rate.

The 1989 to 1993 female age-adjusted cancer mortality rate for colorectal cancer is 11.2/100,000 for the entire IHS service population. Excluding the 3 IHS Areas with apparent problems in underreporting of Indian race on death certificates, the rate is 11.9/100,000. The All IHS rate is significantly lower than the US rate.

Four IHS Areas (Albuquerque, Navajo, Oklahoma, & Phoenix) had rates for females that are significantly lower than the US rate.

Age-Adjusted Liver & Intrahepatic Ducts Cancer Mortality Rates, By IHS Area, Both Sexes, 1989-1993

§ Excludes California, Oklahoma, and Portland Areas in calculation of rate.

Chart 11

The 1989 to 1993 age-adjusted cancer mortality rate for both sexes, pertaining to liver & intrahepatic duct cancer, is 5.1 per 100,000 for the entire IHS service population. Without the 3 IHS Areas with apparent problems in underreporting of Indian race on death certificates, the rate is 6.5 per 100,000. Both rates are significantly higher than the US rate for both sexes.

No IHS Areas had rates significantly higher or lower than the US rate for both sexes.

§ Three IHS Areas (California, Oklahoma, Portland) often underreport Indian race on death certificates. Therefore, the IHS (9 Areas) total is presented excluding these 3 Areas.

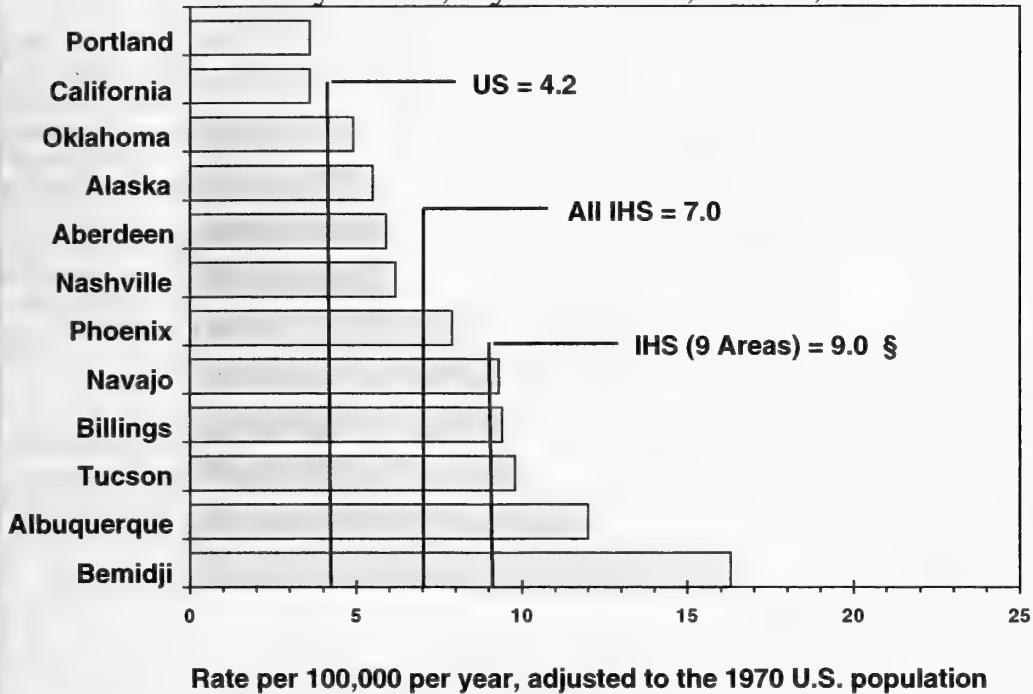

** Denotes a rate significantly different from the US rate.

Table 6 lists the total number of deaths due to all cancers from 1989 to 1993 in addition to the mortality rate by IHS Area for both sexes combined, males, and females.

Mortality rates are calculated per 100,000 per year and are age-adjusted to the 1970 US population. Rates based on small numbers of deaths should be interpreted with caution.

Table 6

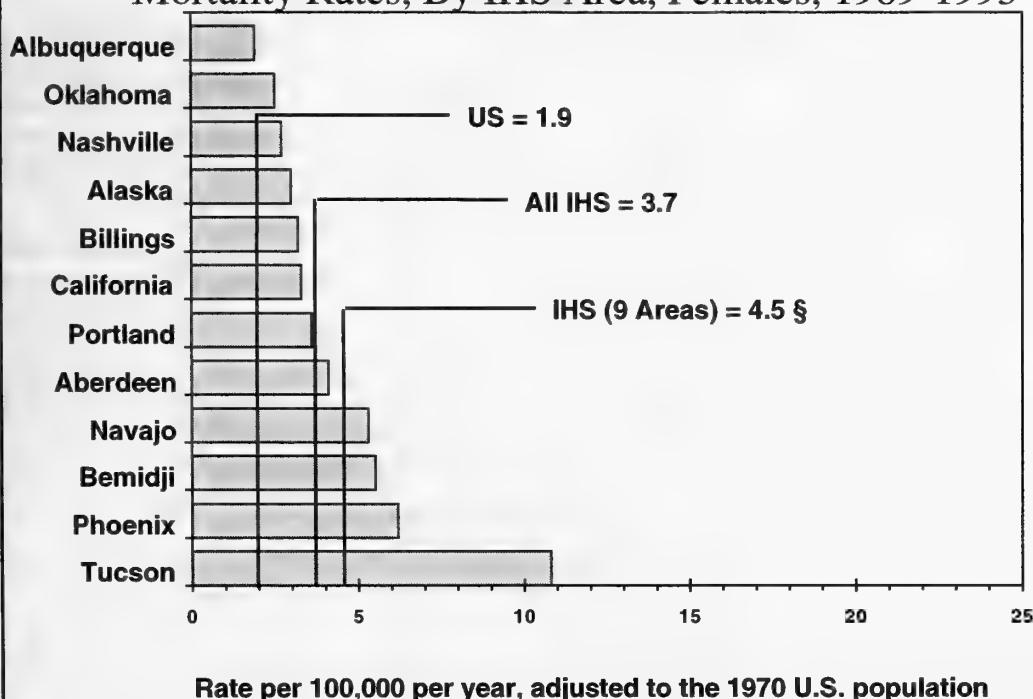

Age-Adjusted Liver & Intrahepatic Ducts Cancer Mortality Rates, By IHS Area, Males, 1989-1993

§ Excludes California, Oklahoma, and Portland Areas in calculation of rate.

Chart 12

Age-Adjusted Liver & Intrahepatic Ducts Cancer Mortality Rates, By IHS Area, Females, 1989-1993

§ Excludes California, Oklahoma, and Portland Areas in calculation of rate.

Chart 13

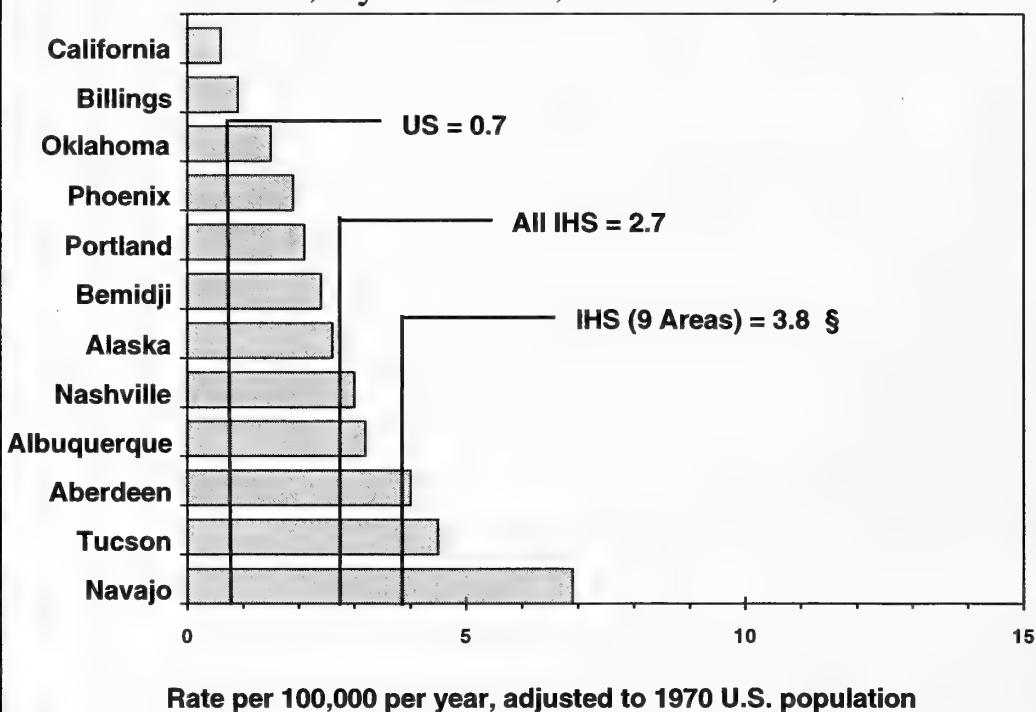

The 1989 to 1993 male age-adjusted cancer mortality rate for liver & intrahepatic duct cancer is 7.0/100,000 for the entire IHS service population. Excluding the 3 IHS Areas with apparent problems in underreporting of Indian race on death certificates, the rate is 9.0/100,000. The IHS (9 Areas) rate is significantly higher than the US rate for males.

No IHS Areas had cancer mortality rates for males that are significantly higher or lower than the US rate.

The 1989 to 1993 female age-adjusted cancer mortality rate for liver & intrahepatic duct cancer is 3.7/100,000 for the entire IHS service population. Excluding the 3 IHS Areas with apparent problems in underreporting of Indian race on death certificates, the rate is 4.5/100,000.

No IHS Areas had rates for females that are significantly higher or lower than the US rate.

Age-Adjusted Gallbladder Cancer Mortality Rates, By IHS Area, Both Sexes, 1989-1993

The 1989 to 1993 age-adjusted cancer mortality rate for both sexes, pertaining to gallbladder cancer, is 2.7 per 100,000 over the entire IHS service population. Excluding the 3 IHS Areas with apparent problems in underreporting of Indian race on death certificates, the rate is 3.8 per 100,000. Both of these rates are significantly higher than the US both sexes rate.

The Navajo IHS Area had a rate that is significantly higher than the US both sexes rate.

§ Excludes California, Oklahoma, and Portland Areas in calculation of rate.

Table 7 lists the total number of deaths due to all cancers from 1989 to 1993 in addition to the mortality rate by IHS Area for both sexes combined, males, and females.

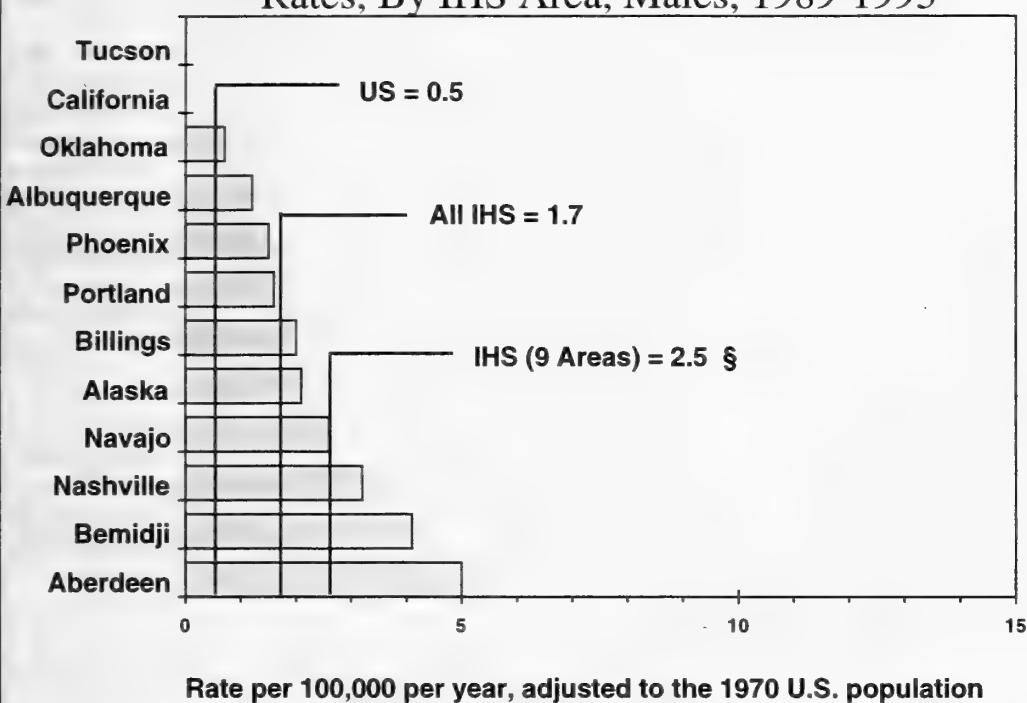

Mortality rates are calculated per 100,000 per year and are age-adjusted to the 1970 US population. Rates based on small numbers of deaths should be interpreted with caution.

§ Three IHS Areas (California, Oklahoma, Portland) often underreport Indian race on death certificates. Therefore, the IHS (9 Areas) total is presented excluding these 3 Areas.

** Denotes a rate significantly different from the US rate.

Table 7

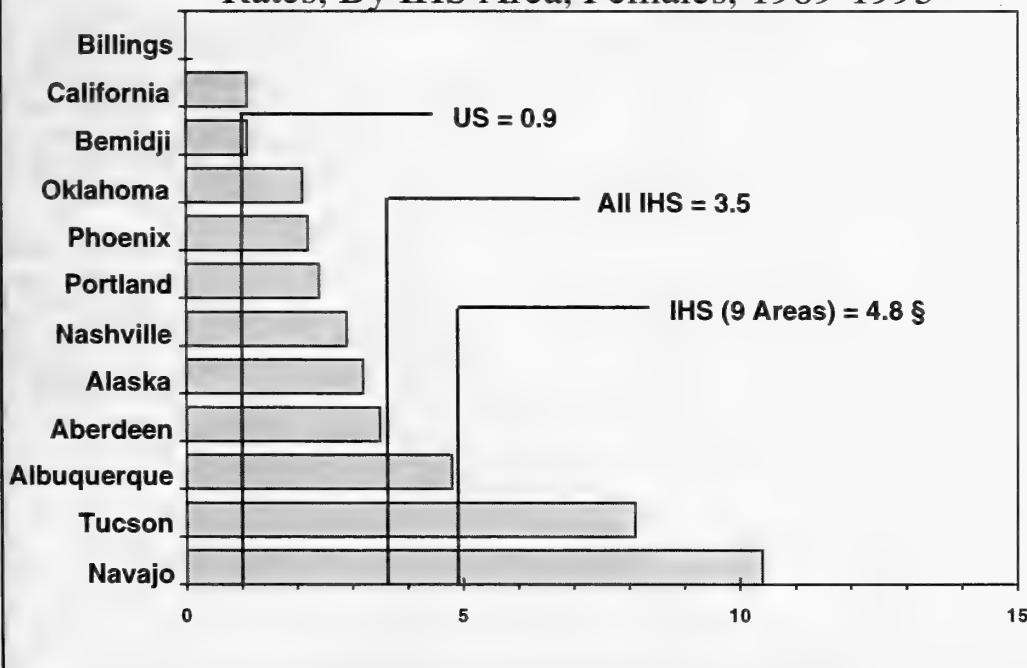

Age-Adjusted Gallbladder Cancer Mortality Rates, By IHS Area, Males, 1989-1993

§ Excludes California, Oklahoma, and Portland Areas in calculation of rate.

Chart 15

Age-Adjusted Gallbladder Cancer Mortality Rates, By IHS Area, Females, 1989-1993

§ Excludes California, Oklahoma, and Portland Areas in calculation of rate.

Chart 16

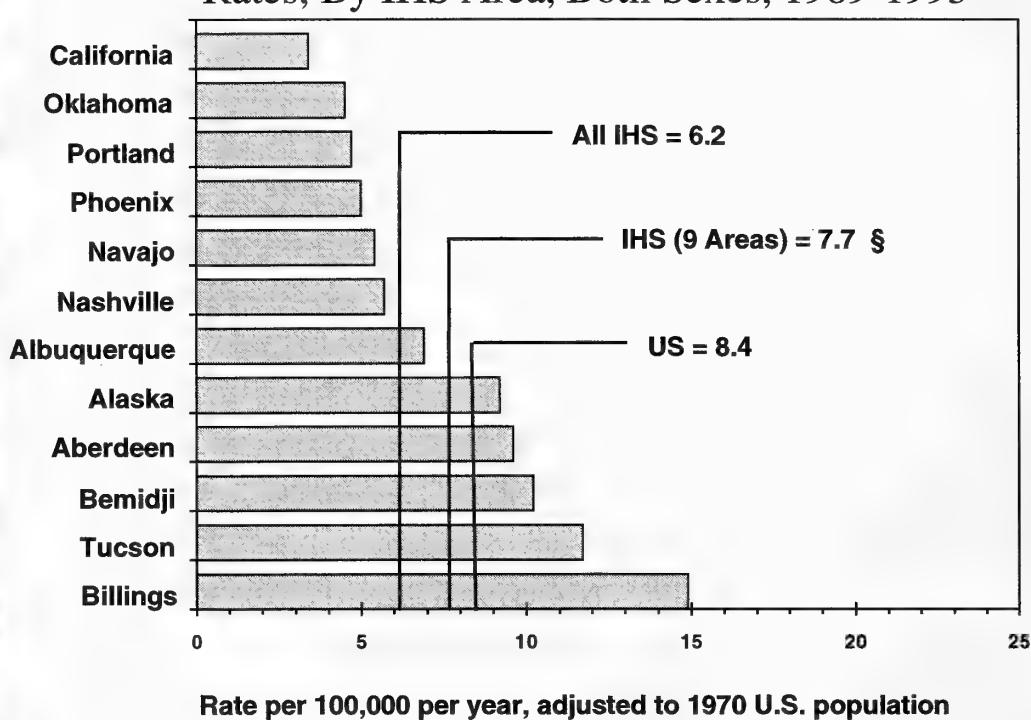

The 1989 to 1993 male age-adjusted cancer mortality rate for gallbladder cancer is 1.7/100,000 for the entire IHS service population. Excluding the 3 IHS Areas with apparent problems in underreporting of Indian race on death certificates, the rate is 2.5/100,000.

Two IHS Areas (California and Tucson) had cancer mortality rates for males that are significantly lower than the US rate.

The 1989 to 1993 female age-adjusted cancer mortality rate for gallbladder cancer is 3.5/100,000 for the entire IHS service population. Excluding the 3 IHS Areas with apparent problems in underreporting of Indian race on death certificates, the rate is 4.8/100,000. Both of these rates are significantly higher than the US rate for females.

The Navajo IHS Area had a rate for females that is significantly higher than the US rate. Conversely, the Billings IHS Area had a rate for females that is significantly lower than the US rate.

Age-Adjusted Pancreas Cancer Mortality Rates, By IHS Area, Both Sexes, 1989-1993

§ Excludes California, Oklahoma, and Portland Areas in calculation of rate.

Chart 17

The 1989 to 1993 age-adjusted cancer mortality rate for both sexes, pertaining to pancreatic cancer, is 6.2 per 100,000 over the entire IHS service population. Without the 3 IHS Areas with apparent problems in underreporting of Indian race on death certificates, the rate is 7.7 per 100,000. The All IHS rate is significantly lower than the rate for US both sexes.

Two IHS Areas (California and Navajo) had a rate that is significantly lower than the US both sexes rate.

Total Number of Deaths and Age-Adjusted Cancer Mortality Rates, Pancreas, By IHS Area, 1989-1993

§ Three IHS Areas (California, Oklahoma, Portland) often underreport Indian race on death certificates. Therefore, the IHS (9 Areas) total is presented excluding these 3 Areas.

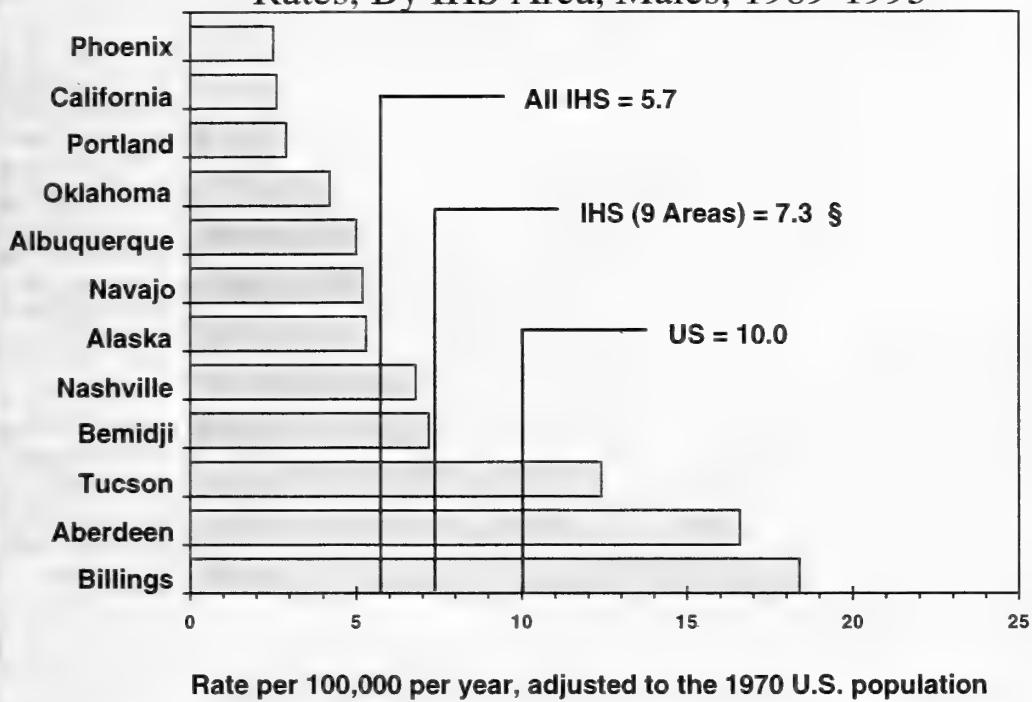

** Denotes a rate significantly different from the US rate.

The 1989 to 1993 age-adjusted cancer mortality rate for both sexes, pertaining to lung cancer, is 30.5 per 100,000 over the entire IHS service population. Without the 3 IHS Areas with apparent problems in underreporting of Indian race on death certificates, the rate is 32.3 per 100,000. Both rates are significantly lower than the US rate for both sexes.

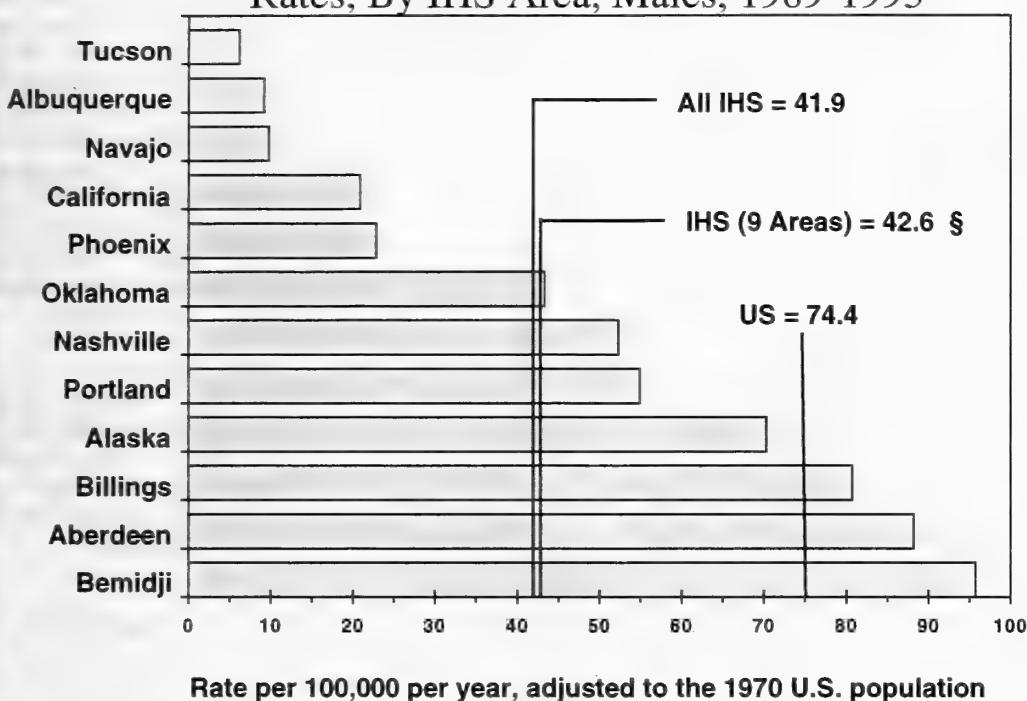

Six IHS Areas (Albuquerque, California, Navajo, Oklahoma, Phoenix, and Tucson) had a rate that is significantly lower than the US both sexes rate.

Table 9 lists the total number of deaths due to all cancers from 1989 to 1993 in addition to the mortality rate by IHS Area for both sexes combined, males, and females.

Mortality rates are calculated per 100,000 per year and are age-adjusted to the 1970 US population. Rates based on small numbers of deaths should be interpreted with caution.

Table 9

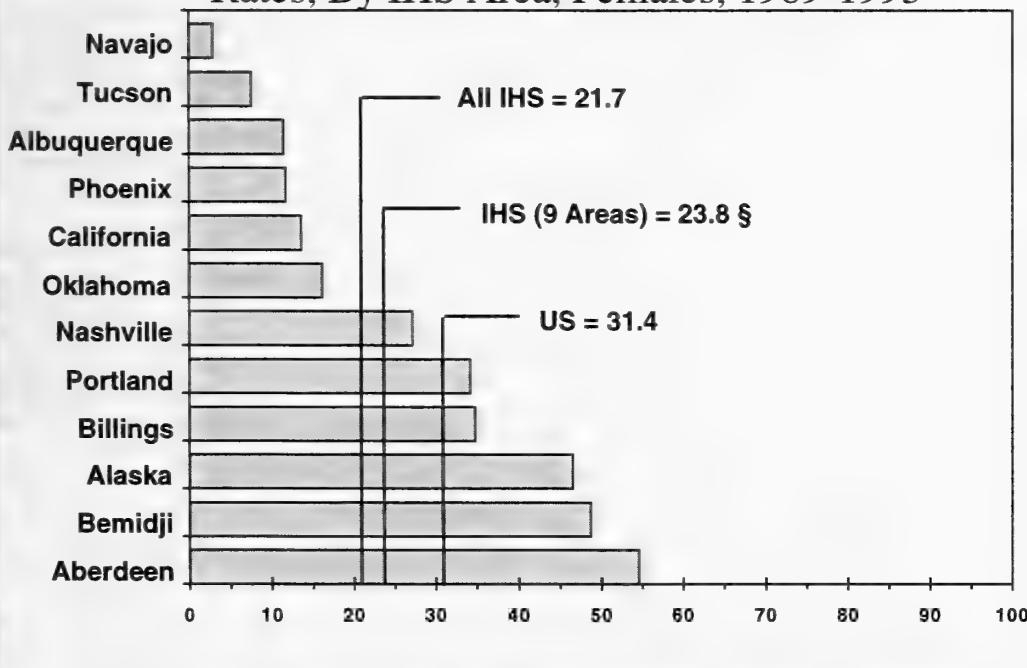

Age-Adjusted Lung Cancer Mortality Rates, By IHS Area, Males, 1989-1993

§ Excludes California, Oklahoma, and Portland Areas in calculation of rate.

Chart 21

Age-Adjusted Lung Cancer Mortality Rates, By IHS Area, Females, 1989-1993

§ Excludes California, Oklahoma, and Portland Areas in calculation of rate.

Chart 22

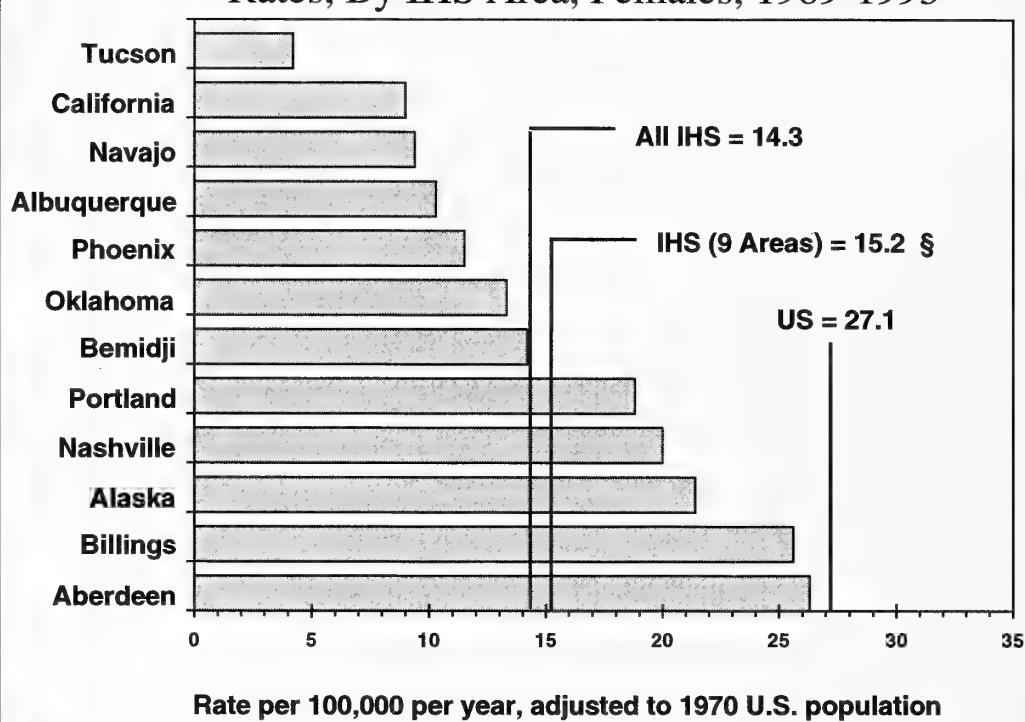

The 1989 to 1993 male age-adjusted cancer mortality rate for lung cancer is 41.9/100,000 for the entire IHS service population. Excluding the 3 IHS Areas with apparent problems in underreporting of Indian race on death certificates, the rate is 42.6/100,000. Both of these rates are significantly lower than the U.S. rate for males.

Six IHS Areas (Albuquerque, California, Navajo, Oklahoma, Phoenix, and Tucson) had cancer mortality rates for males that are significantly lower than the US rate.

The 1989 to 1993 female age-adjusted cancer mortality rate for lung cancer is 21.7/100,000 for the entire IHS service population. Excluding the 3 IHS Areas with apparent problems in underreporting of Indian race on death certificates, the rate is 23.8 per 100,000. Both rates are significantly lower than the US female rate.

Six IHS Areas (Albuquerque, California, Navajo, Oklahoma, Phoenix and Tucson) had a rate that is significantly lower than the US rate for females.

Age-Adjusted Breast Cancer Mortality Rates, By IHS Area, Females, 1989-1993

§ Excludes California, Oklahoma, and Portland Areas in calculation of rate.

Chart 23

The 1989 to 1993 female age-adjusted cancer mortality rate for breast cancer is 14.3 per 100,000 for the entire IHS service population. Excluding the 3 IHS Areas with apparent problems in underreporting of Indian race on death certificates, the rate is 15.2 per 100,000. Both rates are significantly lower than the US rate for females.

Six IHS Areas (Albuquerque, California, Navajo, Oklahoma, Phoenix, and Tucson) had a rate that is significantly lower than the US for females.
